## Upwelling, ecosystems and coastal communities

Fisheries provide employment, economic opportunities and food security for people in coastal areas. Small pelagic fish are an important food source for coastal communities.

To manage fish stocks we need to understand how the strength and location of upwelling changes from year-to-year. This will help us understand future impacts of climate change and help us plan for the future.

Fishers' knowledge and intuition of the marine environment can help improve management and governance of fisheries. This information could also shape future scientific studies.
